CS 2316
Pair Homework 10 – XML Processing
Due: Monday November 21st, before 11:55 PM
Out of 100 points

Files to submit: **1. HW10.py**

This is a PAIR PROGRAMMING Assignment: Work with your partner!
For pair programming assignments, you and your partner should turn in identical
assignments. List both partners names at the top. Your submission must not be
substantially similar to another pairs' submission. Collaboration at a reasonable level will
not result in substantially similar code. Students may only collaborate with fellow
students currently taking CS 2316, the TA's and the lecturer. Collaboration means talking
through problems, assisting with debugging, explaining a concept, etc. You should not
exchange code or write code for others.

For Help:
          - TA Helpdesk – Schedule posted on class website.
          - Email TA's or use T-Square Forums
Notes:
- **Don't forget to include the required comments and collaboration
  statement (as outlined on the course syllabus).**
- **Do not wait until the last minute** to do this assignment in case you run into
  problems.

Background:
You are hired by a consulting firm which specializes in providing support for obsolete
versions of enterprise software that is no longer supported by the original manufacturer.
Companies pay your employer for support contracts so that they do not have to spend
even more money upgrading to the latest version of the software. In some cases, the
original manufacturer has discontinued support for a particular piece of software entirely,
leaving your employer as the only support option for businesses who still use the old
software.

Every Wednesday your job is to visit the IBM website and make a spreadsheet for your
boss that lists all of the software that will no longer be supported within the next year.
You have found a website that offers you this information in XML format. If you could
just download the process the information automatically using Python, you would be able
to play Minecraft most of the rest of the day.

The webpage is:
http://www-01.ibm.com/software/support/lifecycleapp/xmldownload.jsp

On this webpage you can select a certain number of days of updates or use the following URL to download a complete list of data (updated weekly):
http://www.ibm.com/software/support/lifecycle/rss/PLCWeeklyXMLDownload.xml

You will also find the link to the XML schema which is useful for understanding what the data means:
http://www-01.ibm.com/software/support/lifecycleapp/IbmPlcDownload_v2.xsd

Data Download

Your program should download the complete product lifecycle XML file from the URL above. If you are unable to download the data (due to network problems), you should catch any exceptions and show the user a warning dialog.

Data Filtering

If you are successful in downloading the data, your program should examine all products. You are looking for any versions that will no longer be supported by IBM within 365 days from the current date. (The End of Service date is today or later, but less than or equal to 365 days in the future). Any software titles and versions that fall in this category should be exported as explained below. NOTE: Your boss is not interested in software that has already fallen out of service, so do not bother reporting versions where the EOS date is before the current date!

Note that it is possible that a software product will have multiple versions. Each version is then broken down into multiple releases, and each release can have different "Mod Level Numbers". For example, the "AIX Fast Connect for POWER" software has two release mods under version 3, specifically 3.2.x and 3.1.x. Version 3.1.x has an EOS date of 30 Sep 2008, while version 3.2.x does not have an EOS date. Neither of these two versions should appear in your spreadsheet. (Versions 3.2.x because the EOS date is blank, and 3.1.x because the EOS date is in the past, not within 1 year of the current date!)

An example that SHOULD appear in the output data is "AIX Partition Load Manager", version 1, release 1, mod level x, which has an EOS data of '30 Apr 2011'.

Date Math

Python includes libraries that will make it easier to to "date math" to find out if a certain date is within 365 days (in the future) of the current date. We suggest you look at the *datetime* module, and specifically the *date* and *timedelta* objects. Note that timedelta objects have a *days* class variable that will be useful to you. You will have to convert

IBM's date format (DD MON YYYY) into a date object before you can add or subtract it from the current date. Note that IBM uses 3 letter month abbreviations, while the date object expects a number. You may want to use a dictionary to convert between three letter abbreviations and the appropriate numbers.

Output

After your program finds all software products (and versions) that have an End of Service (EOS) date between the current date and one year from the current date, it should produce a CSV file that has the following columns of data:

```
Software Title, Version Number, Release Number, Mod Level Number, EOS Date
```

Note that your CSV file must have the above column headers as it's first row! After that, you will start the data export. For example, here are a few lines of sample data output (assuming today is November 8th, 2011):

```
AIX 5L for POWER,5,3,x,30 Apr 2012
Application Performance Analyzer for z/OS,9,1,x,30 Apr 2012
```

GUI

Your program must have a GUI with a "Do it!" button. When you press the "Do It!" button, your program should open a file save dialog that asks the user where to save the output file. The user should be able to enter the name of a file (such as "IBM_Report.csv") and your program will save the results as a CSV file. After the save is successful, you should update the GUI to say "File successfully saved!".

How to organize your code:

You may organize your code in any way you would like. We suggest you separate the problem up into the following functions. Writing the solution as multiple functions will allow you to break the big problem down into smaller, more manageable steps. You can test each function independently to make sure it works before moving on to the next one.

init – An initializer function that sets up your GUI.

clicked - When the user clicks your "do it!" button, it should start the download, filter, and save functionality, and then update the GUI to report success.

download – A function that downloads the IBM XML file and parses the XML to find the Software Title, Version Number, Release Number, ModLevelNumber and end of service text (if any). It will store all of this data into a list, and pass it to the filter

function.

parseIBMDate – A function that you give an IBM end of service string (in the format: "15 Apr 2009" and returns a python date object that represents that date.

filter – A function that processes each record in a list to determine if it matches our criteria or not. It can call the parseIBMdate function to convert the EOS text for each record into a date, and then compare it to the current date to find out if it is within one year in the future (IBMDate – currentDate should be between 0 and 365 days...negative days means the EOS is in the past, and days larger than 365 means it is more than 1 year in the future) Any records that match your criteria can be saved to a new list and returned.

saveCSV – This function takes in a list of records (where each record consists of a Swtitle, Version Number, Release Number, ModLevel Number and EOS text, and writes those records out to a CSV file, one record per line. You may want to pass in the filename as a parameter.

Grading
You will earn points as follows for each piece of functionality in your code:

GUI   **15**
-Allows specification of Destination file location   10
-Provides feedback/report to the user when done   5

Reading Data Source   **25**
-Downloads data correctly from website   20
-Proper Error Handling   5

XML Parsing / Filtering   **45**
-Software Titles are found   10
-Each version of each title is identified   10
-EOS dates are found for each version of the software   10
-Only titles/versions with an EOS date within 1 year are saved 15

Data Destination   **15**
-Saves data correctly in CSV format   10
-Includes header in CSV file   5

Total Possible: **100**
